

CONTENTS

<i>Preface</i>	ix
<i>List of Symbols</i>	xi
1 History and nature of the gel method	1
1.1 Introduction	1
1.2 Early work	6
1.3 Basic growth procedures	9
1.4 Purity and doping	26
2 Gel structure and properties	29
2.1 Gel preparation and properties	29
2.2 Gelling mechanism and structure of silica hydrogels	34
2.3 Gels as diffusion media	41
3 Growth mechanisms	48
3.1 Diffusion patterns and single crystal growth rates	48
3.2 Functions of the gel	62
3.3 Ultimate crystal size; reimplantation	68
3.4 Cusp formation	71
3.5 Hybrid procedures; calcite growth	74
3.6 Lead sulfide; crystal habit	82
4 Nucleation	89
4.1 General principles	89
4.2 Evidence for homogeneous nucleation	96
4.3 Studies on quasi-homogeneous and heterogeneous nuclei; filtering	99
4.4 Nucleation control	104
4.5 Nucleation and crystal perfection	111
5 Liesegang Rings	116
5.1 R. E. Liesegang	116
5.2 Qualitative features; spiral formation; radiation effects	119
5.3 Problems of quantification; general	131

viii		<i>Contents</i>
5.4	Analytic formulations	137
	Supersaturation models	137
	Competitive particle growth models	145
	Sol coagulation models	150
5.5	Precipitation conditions under supersaturation	152
5.6	Computational analysis:	157
	General considerations and hypothetical experiments	157
	Cautions and opportunities	173
	Appendices	176
1	Supplementary notes on materials grown in gels	176
2	Measurements on gel-grown crystals	180
	<i>References</i>	182
	<i>Index</i>	193
