Foreword	<i>page</i> xiii
Preface	xv
1 Context: The Point of Departure	1
2 Elements of Classical Mechanics	8
2.1 Introduction	8
2.2 Newton’s Second Law	8
2.3 Energy and Work	10
2.4 Virtual Work and D’Alembert’s Principle	11
2.5 Hamilton’s Principle and Lagrange’s Equations	13
2.5.1 Constraints	15
2.5.2 Conservation Laws	15
2.6 Nonconservative Forces and Energy Dissipation	17
2.6.1 Damping	18
2.6.2 Time-Dependent Forces	19
2.7 Strain Energy	20
REFERENCES	21
3 Dynamics in the Vicinity of Equilibrium	22
3.1 The Linear Oscillator	22
3.2 Oscillator with a Slow Sweep of Frequency	28
3.3 Dynamics and Stability	30
3.3.1 Stability Concepts	30
3.4 Bifurcations	32
3.4.1 The Saddle-Node Bifurcation	33
3.4.2 Bifurcations from a Trivial Equilibrium	34
3.4.3 Initial Imperfections	35
3.4.4 Bifurcations of Maps	37
3.5 A Simple Demonstration Model	37
3.6 Experiments	41
REFERENCES	43

4	Higher-Order Systems	45
4.1	Introduction	45
4.2	Multiple-Degree-of-Freedom Systems	45
4.2.1	The Algebraic Eigenvalue Problem	46
4.2.2	Normal Modes	47
4.2.3	Equilibrium, Linearization, and Stability	48
4.2.4	Routh–Hurwitz Criterion	54
4.2.5	Lyapunov Functions	55
4.2.6	Rayleigh’s Quotient	56
4.3	Distributed Systems	57
4.3.1	The Differential Eigenvalue Problem	59
4.3.2	Solution Methods	60
4.3.3	Context Revisited	64
	REFERENCES	64
5	Discrete-Link Models	66
5.1	Introduction	66
5.2	An Inverted Pendulum	66
5.2.1	Static Behavior	67
5.2.2	Geometric Imperfections	69
5.2.3	Dynamic Behavior	70
5.2.4	A Note on Inertia	74
5.3	A Discrete-Strut Model	75
5.4	An Asymmetric Model	80
5.5	A Three-Bar Model	82
5.6	A Snap-Through Model	84
5.7	Augusti’s Model	88
5.8	Multiple Loads	91
5.9	Load-Dependent Supports	93
5.10	Path Following and Continuation	94
	REFERENCES	95
6	Strings, Cables, and Membranes	97
6.1	Introduction	97
6.2	The Stretched String	97
6.2.1	The Wave Equation	97
6.2.2	Traveling-Wave Solution	100
6.2.3	Energy Considerations and Rayleigh’s Principle	101
6.3	A Suspended Cable	102
6.3.1	The Hanging Chain	106
6.4	A Rectangular Membrane	108
	REFERENCES	109

Contents	ix
7 Continuous Struts	111
7.1 Introduction	111
7.2 Basic Formulation	111
7.2.1 The Response	113
7.2.2 The Temporal Solution	114
7.2.3 The Spatial Solution	116
7.3 Rayleigh’s Quotient	120
7.4 Rayleigh–Ritz Analysis	120
7.5 A Galerkin Approach	124
7.6 Higher Modes	126
7.7 Rotating Beams	131
7.8 A Strut with a Tangential Load	134
7.9 Self-Weight	136
7.9.1 A Hanging Beam	138
7.9.2 Experiments	139
7.10 Thermal Loading	142
7.11 Other Effects	143
REFERENCES	143
8 Other Column-Type Structures	147
8.1 A Beam on an Elastic Foundation	147
8.2 Elastically Restrained Supports	149
8.3 Beams with Variable Cross Section	150
8.4 Modal Coupling	154
8.5 Flexural–Torsional Buckling and Vibration	157
8.6 Type of Loading	161
8.7 A Continuous Arch	162
REFERENCES	164
9 Frames	166
9.1 A Beam with General Boundary Conditions	166
9.2 The Stiffness Method	168
9.3 A Self-Strained Frame Example	172
9.4 Modal Analysis	174
9.5 Large-Deflection Analysis	177
9.6 A Tubular Structure	178
REFERENCES	181
10 Plates	183
10.1 Introduction	183
10.1.1 Brief Review of the Classical Theory	183
10.1.2 Strain Energy	187
10.1.3 Boundary and Initial Conditions	188

10.1.4 The Simplest Case	190
10.1.5 Initial Imperfections	193
10.2 The Ritz and Finite-Element Approaches	193
10.3 A Fully Clamped Plate	196
10.4 Moderately Large Deflections	198
10.5 Postbuckling	199
10.6 Mode Jumping	205
10.6.1 Introduction	205
10.6.2 The Analytic Approach	205
10.6.3 Finite-Element Transient Results	209
10.7 Cylindrical Shells	209
REFERENCES	212
11 Nondestructive Testing	216
11.1 Introduction	216
11.1.1 The Southwell Plot	217
11.1.2 Examples	219
11.2 Some Background	222
11.3 Snap-Through Revisited	225
11.4 Range of Prediction	228
11.5 A Box Column	230
11.6 Plates and Shells	231
REFERENCES	234
12 Highly Deformed Structures	237
12.1 Introduction to the Elastica	237
12.2 The Governing Equations	239
12.3 Case Study A: Self-Weight Loading Revisited	240
12.3.1 Numerical Results	241
12.3.2 Experiments	242
12.4 Case Study B: A Heavy Beam	243
12.4.1 Numerical Results	244
12.4.2 Experiments	245
12.5 Case Study C: A Pinched Loop	248
12.6 Case Study D: A Beam Loaded by a Cable	251
12.7 The Softening Loop Revisited	256
REFERENCES	259
13 Suddenly Applied Loads	261
13.1 Load Classification	261
13.2 Back to Link Models	262
13.3 Dynamic Buckling of a Plate	267
13.4 A Type of Escaping Motion	268
13.5 Impulsive Loading	272

Contents	xi
13.5.1 Equilibrium Behavior	273
13.5.2 Behavior under Sudden Loading	274
13.6 Snap-Through of a Curved Panel	275
REFERENCES	279
14 Harmonic Loading: Parametric Excitation	282
14.1 An Oscillating End Load	282
14.2 The Variational Equation	283
14.3 Mathieu’s Equation	286
14.4 Pulsating Axial Loads on Shells	288
14.4.1 A Curved Panel	289
14.4.2 A Cylindrical Shell	289
REFERENCES	292
15 Harmonic Loading: Transverse Excitation	294
15.1 Introduction: Resonance Effects	294
15.1.1 A Single-Mode Approximation	295
15.1.2 Beyond Buckling	296
15.2 The Poincaré Section	297
15.3 Continuous Systems	299
15.4 An Application to Vibration Isolation	304
15.4.1 Postbuckling of a Strut Revisited	305
15.4.2 Experimental Verification	306
15.4.3 The Forced Response	307
15.5 Forced Excitation of the Thermally Buckled Plate	308
REFERENCES	310
16 Nonlinear Vibration	312
PART I: FREE VIBRATION	312
16.1 Introduction	312
16.2 Abstract Models	313
16.3 A Mass Between Stretched Springs	315
16.4 Nonlinear Vibration of Strings	319
16.5 Nonlinear Vibration of Beams	320
16.6 Nonlinear Vibration of a Plate	322
16.7 Nonlinear Vibration in Cylindrical Shells	324
PART II: FORCED VIBRATION	325
16.8 Nonlinear Forced Vibration of Strings	325
16.9 Nonlinear Forced Vibration of Beams	326
16.10 Persistent Snap-Through Behavior in a Plate	330
16.11 A Panel in Supersonic Flow	334
16.12 Chaotic Behavior	337
REFERENCES	344
Index	347
