1	Introduction: Some history and some examples	1
2	A statement of the problem, the notation and some definitions	5
3	(In)admissibility and dominators	15
	3.1 Results for the exponential family	15
	3.2 Results of Moors	18
	3.3 Results of Charras and van Eeden	20
	3.4 Dominators	23
	3.5 Universal domination and universal admissibility	29
	3.6 Discussion and open problems	29
4	Minimax estimators and their admissibility	33
	4.1 Some helpful results	33
	4.2 Minimax results when Θ is bounded	40
	4.3 Minimax results when $k = 1$ and Θ is not bounded	49
	4.4 Minimax results when $k > 1$ and Θ is not bounded	59
	4.5 Discussion and open problems	63
5	Presence of nuisance parameters	69
	5.1 Location parameter estimation with known ν	71
	5.2 Scale parameter estimation with known ν	80
	5.3 Unknown ν	88
	5.4 Polygonal, orthant and circular cones	96
	5.5 (Admissible) minimax estimators	98
	5.6 Discussion and open problems	100
6	The linear model	103
	6.1 One linear inequality restriction	104
	6.2 Interval and quadrant restrictions	109

6.3	Results of Moors and van Houwelingen for polyhedral and ellipsoidal restrictions	112
6.4	Discussion and open problems	112
7	Other properties	115
7.1	Ideas from weighted likelihood estimation	115
7.2	Robustness, gains in risk function and bias	117
8	Existence of MLEs and algorithms to compute them	131
8.1	The model and the conditions	131
8.2	Algorithms	133
8.3	Norm-reducing properties of MLEs	139
8.4	Algorithms for multivariate problems	141
	Bibliography	143
	Author Index	161
	Subject Index	165
